Other Site Characteristics

Espacio principalmente fluvial situado en la ribera izquierda del río Noguera Ribagorçana, en el extremo norte-occidental del pre-pirineo central catalán, en una zona de sustratos calcáreos. Está constituido por una serie de relieves calcáreos de una cierta complejidad tectónica, con cumbres que sobrepasan los 1.800 m y vertientes meridionales con fuerte pendiente y septentrionales más suaves. El paisaje es predominantemente submediterráneo y una gran parte del país corresponde al dominio del roble seco de Quercus pubescens. La vall alta del Serradell prolonga el extremo meridional de la Sierra de St. Gervàsun mediante un continuo de pequeñas sierras.

4.2 Quality and importance

Espacio representativo de la vegetación submediterránea de Catalunya muy en contacto con las sierras prepirenaicas de Aragón. Destaca la presencia de una diversidad faunística, especialmente de especies de características rupícolas. Este espacio, además, contiene una buena población de cangrejo autóctono Autropotamobius pallipes.
